Storage System

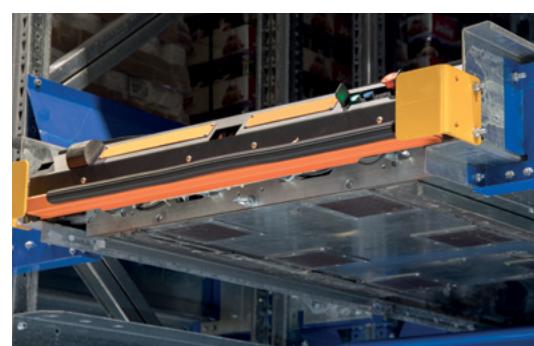

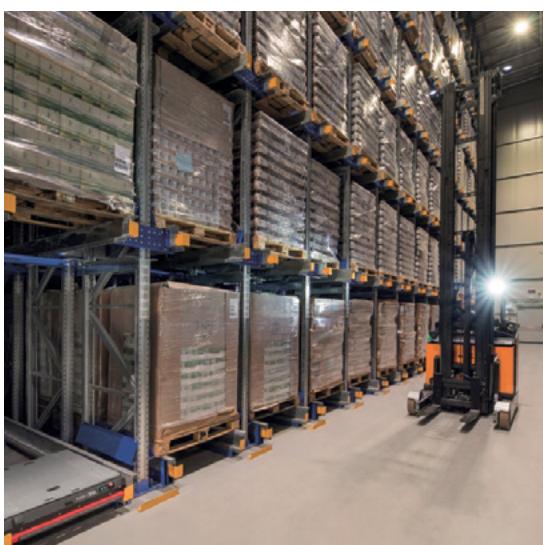

► Pallet Racking

The pallet racking system is the most widespread system for storing and directly accessing each pallet. Frames allow the realization of structures with important vertical extensions, multi-tiered storage levels, and high load capacities. Automatic storage systems and clad-rack warehouses are made with the same structural elements.

► Pallet Shuttle

The multi-depth storage system with shuttle powered by lithium battery is the ideal solution to manage the storage for large quantities of pallets by item with high rotation frequency. It facilitates the pallet loading and unloading into the various channels.

➤ Drive-In Racking

The ideal solution for high-density storage allowing the elimination of picking aisles. Suitable for all sectors handling palletized products of homogeneous type or with slow rotation frequency (LIFO logic).

➤ Gravity-fed Racking

Solution for high density storage with high rotation and homogeneous products.

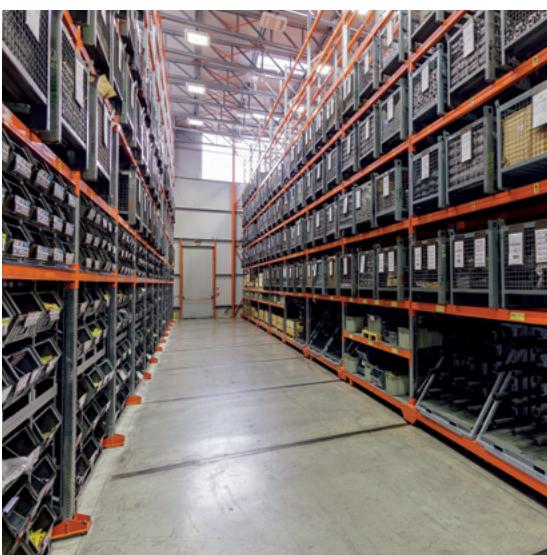

The system is equipped with self-braking rollers for the space optimization (FIFO logic).

➤ Mobile Pallet Racking System

It is the most suitable solution for high-density storage of materials with a low to medium rotation frequency.

The mobility of the racks that slide on tracks allows, when necessary, to open the aisle of interest leaving the other racking compacted, thus saving all the aisles not involved in handling.

► Dimax - Multi-Purpose Shelving

It is a modular storage system ideal for every picking needs. This shelving can be supplied as single- or double-sided structure, for medium and lightweight loads that vary from very light home and office applications to multi-tier storage solutions with staircases, walkways, and gates.

► Mobile Shelving

A must for libraries, offices, archives, pharmacies, workshops, the mobile shelving systems eliminate fixed aisles that waste space, giving more filing capacity within the same footprint. The translation of the shelving, mounted on carriages that slide and move along floor rails, is obtained by a mechanical or electric mechanism ensuring the simultaneous movement of one or more elements without great effort.

► Mezzanine Floor GL8

The GL8 mezzanine floor is a system that increases the useful storage area of warehouses by exploiting the vertical space available of the buildings, while at the same time allowing for large open spaces free of columns. The structure is completed with different options of flooring and decking, railings, stairs, and gates.

► Cantilever Racking

Cantilever racking is the ideal industrial racking solution for long and bulky items such as bars, pipes, metal sheets, timber, and panels.

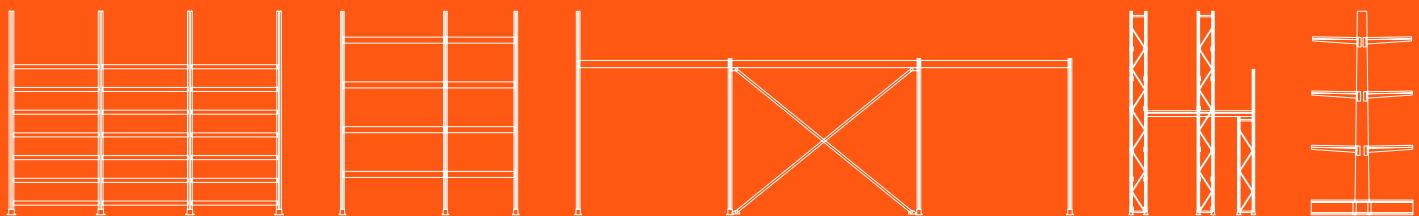

It simplifies and optimizes the work offering the ability to select from single or double-sided storage. When installed outdoors, it can be fitted with special roofs.
